

## **NEW RELEASE Jan 2011 – MICRO EYE SENSOR**

New sensor unit is being finalized for January release which will allow new and existing users even more ability to hide units on location with a minimal visual impact.

The old unit on left has been difficult at times to hide so we are introducing the new unit on right as a switch out option.

Measuring only 1 " x 1.75" it allows expanded ability to disguise the sensors in block work, wall cavities and other such hides. The ability to drill a pilot hole into lumber and hide the unit allows the sensor to be seen as a piece of discarded lumber or other such hide.

The sensor lenses will be available in black (Pictured) or off white.

For those with existing cameras, the lenses cable is the same measure of 20' and simply plugs into the back end of the camera unit in the same manner as before using the existing equipment.

Pricing will be available in early January.
